

Light Point ZEBRA+

ACZP+ALFUM

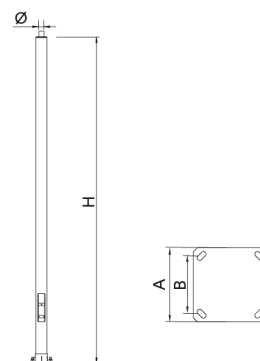

ZEBRA+ light point, the solution for pedestrian crossing lighting, designed to reduce the number of accidents and increase safety. ZEBRA+ ensures that people are not left in the dark and are properly illuminated, preventing possible accidents due to incorrect lighting. It also allows the driver to avoid being dazzled, as the light is focused on the pedestrian, minimizing the risk of glare for drivers.

Additionally, this version is equipped with an intelligent detection system, which incorporates a control node and a motion sensor that only detects pedestrians. At this very moment, the luminaire increases the power level to its maximum and lights up the luminous crown, warning the driver of the pedestrian's presence while focusing the illumination on the area of interest.

The intelligent system allows the command to be replicated to the opposite light point and vice versa, making it a highly versatile solution for different road configurations with multiple lanes and varying directions of travel.

Pole manufactured in S-235 JR hot-galvanized steel, with lateral Ø60 mm fixing.
